Problemas

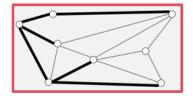

Árbol de Expansión

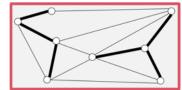

Un **árbol de expansión** de un grafo G(E, V) es un árbol que:

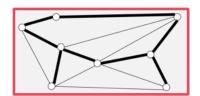

- Incluye todos los vértices de G
- Es un subgrafo de G
- Está conectado
- Es acíclico

Árbol de Expansión

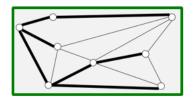

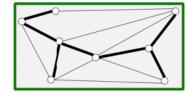

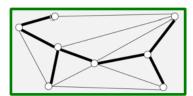

Un **árbol de expansión** de un grafo G(E, V) es un árbol que:

- Incluye todos los vértices de G
- Es un subgrafo de G
- Está conectado
- Es acíclico

Árbol de Expansión

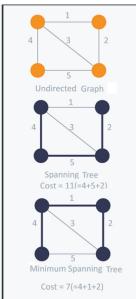

Un **árbol de expansión** de un grafo G(E, V) es un árbol que:

- Incluye todos los vértices de G
- Es un subgrafo de G
- Está conectado
- Es acíclico

Un árbol de expansión mínimo de un grafo G(E, V) es un árbol de expansión cuyo costo es el menor entre todos los demás árboles de expansión

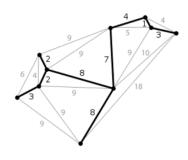

Problema

Dado un grafo no dirigido G = (V, E) con una función de peso $w : E \longrightarrow R$ Deseamos encontrar un subconjunto acíclico $T \subseteq E$ que conecte todos los vértices y cuyo costo sea mínimo.

$$w(T) = \sum_{(u,v)\in T} w(u,v)$$

T es el MST (Minimum Spanning Tree)

Problema

Dado un grafo no dirigido G = (V, E) con una función de peso $w : E \longrightarrow R$, deseamos hallar un **MST** para G.

Solución voraz

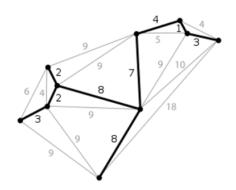

Idea:

Hacer crecer el MST un arco a la vez.

Estrategia:

Mantener un conjunto de arcos \boldsymbol{A} que crece cumpliendo el siguiente invariante.

INV: A es un subconjunto de algún MST

Problema

Dado un grafo no dirigido G = (V, E) con una función de peso $w : E \longrightarrow R$, deseamos hallar un **MST** para G.

Solución voraz

Idea:

Estrategia: Mantener un conjunto de arcos *A* que crece cumpliendo el siguiente invariante.

Hacer crecer el MST un arco a la vez

INV: A es un subconjunto de algún MST

```
GENERIC-MST(G, w)

1 A = \emptyset

2 while A does not form a spanning tree

3 find an edge (u, v) that is safe for A

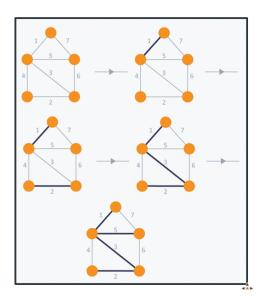

4 A = A \cup \{(u, v)\}

5 return A
```

Algoritmo de Kruskal's

- 1 Ordenar los arcos del grafo con relación a su peso
- 2 Agregar el arco con el menor costo al árbol de expansión, que conecte componentes que no estén conectados (para evitar ciclos)
- 3 Repetir el paso 2 hasta cubrir todos los vértices

Algoritmo de aproximación voraz

Algoritmo de Kruskal's

- 1 Ordenar los arcos del grafo con relación a su peso
- 2 Agregar el arco con el menor costo al árbol de expansión, que conecte componentes que no estén conectados aún (para evitar ciclos)
- 3 Repetir el paso 2 hasta cubrir todos los vértices

Algoritmo de aproximación voraz $\Theta(E \log V)$

```
MST-KRUSKAL(G, w)
   A = \emptyset
   for each vertex v \in G.V
       MAKE-SET(\nu)
   sort the edges of G.E into
        nondecreasing order by weight w
   for each edge (u, v) \in G.E,
       taken in nondecreasing order by weight
        if FIND-SET(u) \neq FIND-SET(v)
             A = A \cup \{(u, v)\}
             Union(u, v)
    return A
```

Algoritmo de Kruskal's

Este algoritmo encuentra un 'arco seguro' para añadir al bosque creciente. De todos los arcos que conectan dos arboles cualquiera en el bosque selecciona un arco (u, v)

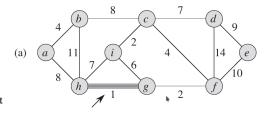

de menor peso.

```
MST-KRUSKAL(G, w)
   A = \emptyset
   for each vertex v \in G.V
       MAKE-SET(\nu)
   sort the edges of G.E into
        nondecreasing order by weight w
   for each edge (u, v) \in G.E,
       taken in nondecreasing order by weight
6
        if FIND-SET(u) \neq FIND-SET(v)
             A = A \cup \{(u, v)\}
             Union(u, v)
    return A
```

Algoritmo de Kruskal's

```
MST-KRUSKAL(G, w)
1 A = Ø
2 for each vertex v ∈ G.V
3 MAKE-SET(v)
4 sort the edges of G.E into nondecreasing order by weight w
5 for each edge (u, v) ∈ G.E, taken in nondecreasing order by weight
```

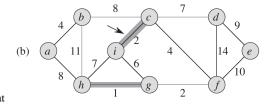

Algoritmo de Kruskal's

```
MST-KRUSKAL(G, w)

11
                  v.key = w(u, v)
```

Algoritmo de Prim

El árbol comienza desde un vértice arbitrario r como raíz y crece hasta que el árbol llega a todos los vértices en V.

En cada paso se añade al árbol A un enlace que conecta A con un vértice aislado, uno en el que ningún enlace de A es incidente.

```

Circuitos

Problema

En el diseño de circuitos electrónicos es necesario interconectar diversos componentes eléctricos con un cable entre ellos.

Para interconectar un conjunto de n pines, podemos utilizar n-1 cables. La interconexión que use la menor cantidad de cable es el mas deseable.

Circuitos

Problema

Este problema se puede modelar como un grafo no dirigido G = (V, E), dónde

V : es el conjunto de pines,

E : es el conjunto posibles conexiones entre parejas de pines

 $w: E \longrightarrow R$; es la longitud del cable de u

Deseamos encontrar un \mathbf{MST} para G

Solución ;?
